Abstract:

The present disclosure relates to systems and methods, and provides a smart luggage cloak and delivery system (100) configured to integrate luggage pickup, secure tracking, authenticated verification, and on-demand delivery within a unified digital platform. The smart luggage cloak and delivery system (100) includes a traveler mobile application (102), a delivery partner management module (104), a secure storage hub infrastructure (106), a GPS-enabled tracking module (108), and an OTP and QR code authentication mechanism (110). Upon a traveler booking, the delivery partner management module (104) assigns the nearest verified delivery partner, the OTP and QR code authentication mechanism (110) confirms secure handover, and the GPS-enabled tracking module (108) provides continuous luggage monitoring during transit. This disclosure achieves a cost-effective, transparent, and scalable alternative to conventional cloakrooms and ad-hoc luggage solutions.

Complete Specification

Description: TECHNICAL FIELD

[001] The present invention relates to the field of smart logistics and travel assistance systems, and more particularly to a System and Method for Smart Luggage Cloud On-Demand Delivery configured to integrate technology-driven luggage pickup, secure storage, real-time tracking, and on-demand delivery through an integrated network and cloud-based ecosystem.

BACKGROUND

[002] The field of smart logistics and travel assistance systems has witnessed significant development in recent years, driven by increasing urbanisation, rising tourism, and the proliferation of short-duration travel facilitated by rail and air networks. Transit passengers, one-day tourists, and travelers with brief layovers constitute a growing segment of the traveling population. These travelers typically require temporary management of their personal luggage for durations ranging from a few hours to a few days, during which they seek to explore cities, attend meetings, or undertake leisure activities without the encumbrance of heavy baggage. The management of luggage during such short-duration transit periods represents a persistent logistical challenge that existing infrastructure has not adequately addressed in a technically integrated manner.

[003] Conventional luggage cloakroom facilities, typically found at railway stations and airports, may offer basic temporary storage; however, such facilities suffer from several well-documented operational limitations. These facilities typically operate during restricted hours and may not be accessible at all times of day, rendering them unsuitable for travelers with early-morning arrivals or late-night departures. Furthermore, conventional cloakrooms rely on paper-based receipt systems that lack digital traceability, provide no mechanism for real-time monitoring of stored items, and offer no confirmation of luggage condition at the time of deposit. The absence of a
